

Oxidation-Reduction (Redox) Rxns

e⁻ transfer rxns.

Batteries / Aging

Imagine:

Oxidation = Loss of e⁻s

Mg was oxidized

Reduction = Gain of e⁻s

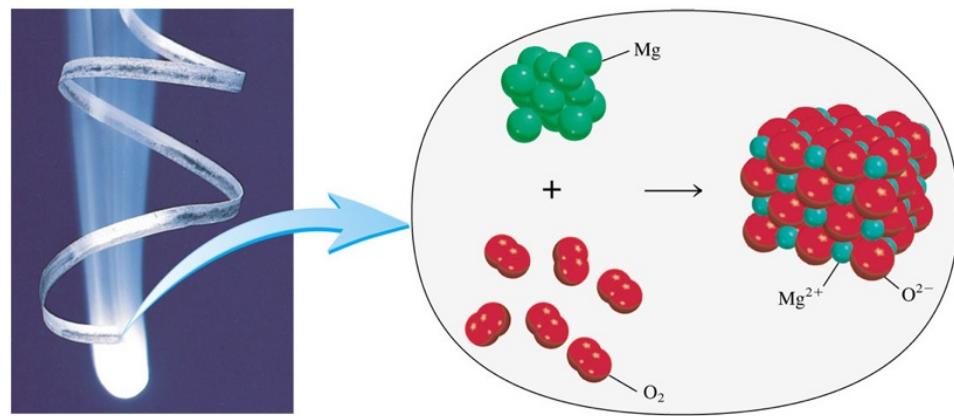

O₂ was reduced

O₂ was the
oxidizing agent

O₂ caused Mg
to be oxidized

Mg caused O₂
to be reduced.
Mg was the
reducing agent

There is a fool-proof method for determining the substance that was Ox/red.

OIL RIG Ox. is loss (e^-)
red. is gain (e^-)

LEO goes GER loss of electrons is oxidation
gain of electrons is reduction

We have to assign an OXIDATION NUMBER (O.N., ox.#) to each atom in substance.

Substances that have atoms that increase in OX # are OXIDIZED

Substances that have atoms that decrease in OX # are REDUCED.

Rules

(1) Atoms in elements = 0

ex: $\text{He}^{(0)}$, $\text{H}_2^{(0)}$, $\text{F}_2^{(0)}$, $\text{P}_4^{(0)}$, $\text{S}_8^{(0)}$

(2) Atoms in monatomic ions = Charge

ex: $\text{Li}^+(+1)$, $\text{S}^{2-}(-2)$, $\text{Al}^{3+}(+3)$, $\text{C}^{4-}(-4)$

charge: $\# \pm$ ox.#: $\pm \#$

(3) Oxygen in cpds = -2

but in H_2O_2 and O_2^{2-} = -1

ex: $\text{H}_2\text{O}^{(-2)}$ $\text{C}_6\text{H}_{12}\text{O}_6^{(-2)}$ $\text{H}_2\text{O}_2^{(-1)}$

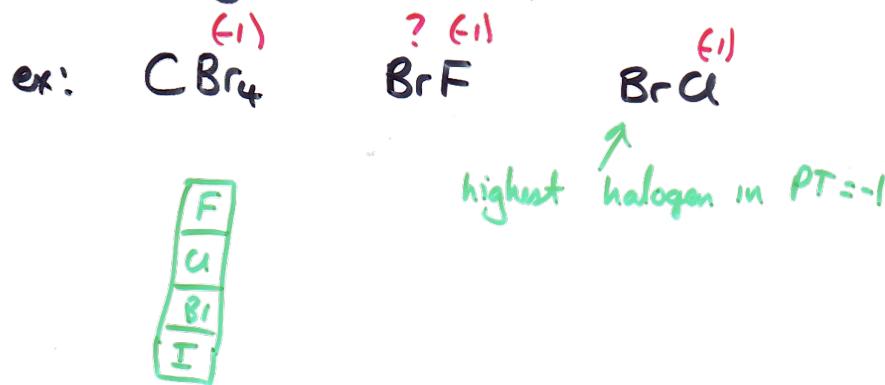

(4) Hydrogen in cpds = +1
(= -1 in metal hydrides)

ex: $\text{H}_2\text{O}^{(+1)}$, $\text{C}_6\text{H}_{12}\text{O}_6^{(+1)}$, $\text{Li}^{(+1)}\text{H}^{-1}$
 Li^+H^-

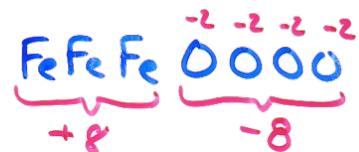

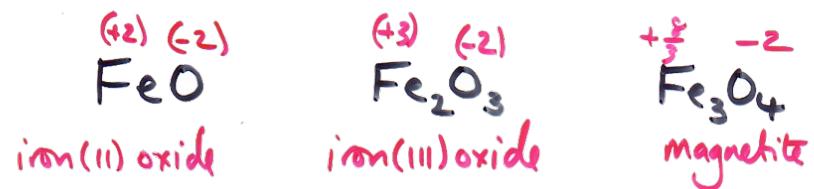

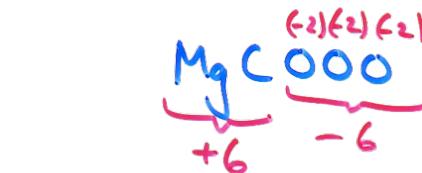

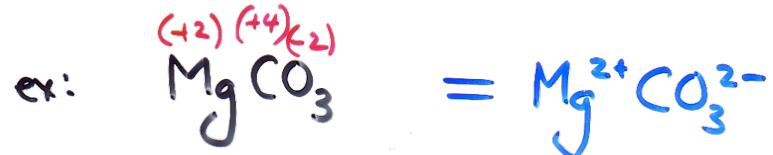

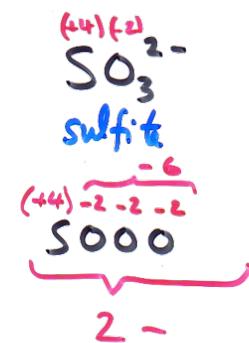

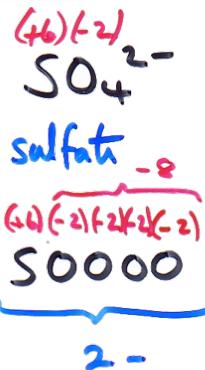

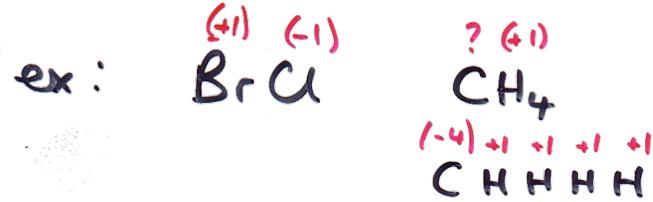

(5) Fluorine in cpds = -1

Halogens in cpds are often -1,
unless they're combined w/ O or F

(6) Sum of ox #'s for each atom
in substance = CHARGE.

ex:

CH_4 was oxidized to form CO_2

O_2 was reduced to form $\text{CO}_2 + \text{H}_2\text{O}$

C: $-4 \rightarrow +4$ (increase in ox#)
 \Rightarrow OXIDIZED

O: $0 \rightarrow -2$ (reduction in ox#)
 \Rightarrow REDUCED

CH_4 "caused" O_2 to be reduced!

$\Rightarrow \text{CH}_4$ is the reducing agent

O_2 "caused" CH_4 to be oxidized

$\Rightarrow \text{O}_2$ is the oxidizing agent!
